Searching for Holes in the Matrix Universe

Searching for Holes in the Matrix Universe

Lucas Kerbs

Spring 2022

- Eventual goal: lift the tools of algebraic topology to spaces of matrices
- If we only consider 2×2 matrices we can use classical theory
- The moment we want more than one size, things the classical theory breaks down
- Today we will develop some *fairly heftly* tools to do just that
- Along the way, hopefully I can convince you that this is an interesting question.
- To do so, we need to go back to our mathematical roots

Part I: Objects and Maps

A Naive Attempt

Part I: Objects and Maps
A Naive Attempt

- That’s right—objects and maps.
- Our Naive attempt involves that looking at lifting functions on \mathbb{R} or \mathbb{C} to accept matrices as their input.
- An operator theorist would call this a “functional calculus”

Functional Calculus

Let $f \in \mathbb{R}[x]$ and $A \in M_k(\mathbb{C})$ be self adjoint.

2022-06-02

Searching for Holes in the Matrix Universe

└ Part I: Objects and Maps

└ Functional Calculus

└ Functional Calculus

- Polynomials are the most well behaved functions we have, so lets start with a polynomial and a self adjoint ($A = A^*$) matrix.
- You might say that SA is unnecessary bc we can already evaluate a polynomial on a matrix

Functional Calculus

Let $f \in \mathbb{R}[x]$ and $A \in M_k(\mathbb{C})$ be self adjoint.
 A is diagonalizable as $A = U \Lambda U^*$

└ Functional Calculus

└ Example: $g(x) = x^3$ Example: $g(x) = x^3$

$$g(X + tH) = X^3 + tX^2H + tXHX + t^2XH^2 \\ + tHX^2 + t^2HXX + t^2H^2X + t^3H^3.$$

From here, we can calculate:

$$\frac{d}{dt}g(X + tH) = X^2H + XHX + 2tXH^2 + HX^2 \\ + 2tHXX + 2tH^2X + 3t^2H^3$$

- Now we consider an example. Since $Df(X)[H]$ is linear, we can just work with a single monomial
- First we expand $(x + th)^3$ —but we can't use the binomial theorem since x and h don't commute
- Once we expand, we take standard derivatives w.r.t t —treating X and H as formal symbols.

Example: $g(x) = x^3$

$$g(X + tH) = X^3 + tX^2H + tXHX + t^2XH^2 \\ + tHX^2 + t^2HXX + t^2H^2X + t^3H^3.$$

From here, we can calculate:

$$\frac{d}{dt}g(X + tH) = X^2H + XHX + 2tXH^2 + HX^2 \\ + 2tHXX + 2tH^2X + 3t^2H^3$$

$$\frac{d^2}{dt^2}g(X + tH) = 2XH^2 + 2HXX + 2H^2X + 6tH^3$$

Definition: *Free Gradient*

Given a tracial function f , the free gradient, ∇f , is the unique free function satisfying

$$\text{tr}(H \cdot \nabla f(X)) = Df(X)[H],$$

where, if $A = (A_1, \dots, A_g)$ and $B = (B_1, \dots, B_g)$ are tuples of like-size matrices then $A \cdot B = \sum_{i=1}^g A_i B_i$.

2022-06-02

Searching for Holes in the Matrix Universe

└ Part I: Objects and Maps

└ Uniqueness of the Gradient

Definition: Free Gradient
Given a tracial function f , the free gradient, ∇f , is the unique free function satisfying

$$\text{tr}(H \cdot \nabla f(X)) = Df(X)[H],$$

where, if $A = (A_1, \dots, A_g)$ and $B = (B_1, \dots, B_g)$ are tuples of like-size matrices then $A \cdot B = \sum_{i=1}^g A_i B_i$.

- The ∇ of a free function is the unique free function satisfy this equation—where the \cdot is just like the dot product
- Whenever you see $\text{tr}(\cdot)$ I want you to think of the inner product—it is slightly distinct but it will make a lot of things make more sense
- Some of you may be hesitant at the fact that I claim ∇ is unique. Why should this be true?

Why should ∇f be unique?

Theorem (Trace Duality)

Let f, g be free functions $\mathcal{M}^g \rightarrow \mathcal{M}^{\tilde{g}}$. If $\text{tr}(H \cdot f) = \text{tr}(H \cdot g)$ for all tuples H , then $f = g$.

2022-06-02

Searching for Holes in the Matrix Universe

└ Part I: Objects and Maps

└ Uniqueness of the Gradient

└ Why should ∇f be unique?

- $f = g$ whenever the domains overlap
- In the vector space setting—with an inner product—this is a fairly immediate result. You would show it by picking vectors of all 0's and a single 1.
- You prove this identically—but with coordinate matrices instead of coordinate vectors.

Example: $\pi_1^{\text{tr}}(GL)$

Let $GL = \bigcup_{n \in \mathbb{N}} GL_n(\mathbb{C})$.

$GL_1(\mathbb{C}) = \mathbb{C} \setminus \{0\}$. Since $\pi_1(GL_1) \simeq \mathbb{Z}$, $\pi_1^{\text{tr}}(GL)_1 \simeq \mathbb{Z}$ as well.

Inclusion into $\pi_1^{\text{tr}}(GL)_2$ picks up square roots. If $\gamma \in \pi_1^{\text{tr}}(GL)_1$, then

$$\begin{bmatrix} \gamma & \\ & \tau \end{bmatrix} \in \pi_1^{\text{tr}}(GL)_2.$$

Thus, $\pi_1^{\text{tr}}(GL)_2 \simeq \mathbb{Z} \left[\frac{1}{2} \right]$.

Searching for Holes in the Matrix Universe

└ Computing $\pi_1^{\text{tr}}(D)$

└ An Example

└ Example: $\pi_1^{\text{tr}}(GL)$

Let $GL = \bigcup_{n \in \mathbb{N}} GL_n(\mathbb{C})$.

$GL_1(\mathbb{C}) = \mathbb{C} \setminus \{0\}$. Since $\pi_1(GL_1) \simeq \mathbb{Z}$, $\pi_1^{\text{tr}}(GL)_1 \simeq \mathbb{Z}$ as well.

Inclusion into $\pi_1^{\text{tr}}(GL)_2$ picks up square roots. If $\gamma \in \pi_1^{\text{tr}}(GL)_1$, then

$$\begin{bmatrix} \gamma & \\ & \tau \end{bmatrix} \in \pi_1^{\text{tr}}(GL)_2.$$

Thus, $\pi_1^{\text{tr}}(GL)_2 \simeq \mathbb{Z} \left[\frac{1}{2} \right]$.

Similarly, inclusion into $\pi_1^{\text{tr}}(GL)_{3!}$ picks up cube roots:

$$\pi_1^{\text{tr}}(GL)_6 \simeq \mathbb{Z} \left[\frac{1}{2}, \frac{1}{3} \right]$$

$$\pi_1^{\text{tr}}(GL)_6 \simeq \mathbb{Z} \left[\frac{1}{2}, \frac{1}{3} \right]$$

Similarly, inclusion into $\pi_1^{\text{tr}}(GL)_{3!}$ picks up cube roots:

$$\pi_1^{\text{tr}}(GL)_6 \simeq \mathbb{Z} \left[\frac{1}{2}, \frac{1}{3} \right]$$

In the n -th inclusion, we pick up n -th roots and so we adjoin $\frac{1}{n}$ to the preceding group. Therefore,

$$\pi_1^{\text{tr}}(GL) \simeq \mathbb{Z} \left[\frac{1}{2}, \frac{1}{3}, \frac{1}{4}, \dots \right]$$

Similarly, inclusion into $\pi_1^{\text{tr}}(GL)_6$ picks up cube roots:

$$\pi_1^{\text{tr}}(GL)_6 \simeq \mathbb{Z} \left[\frac{1}{2}, \frac{1}{3} \right]$$

In the n -th inclusion, we pick up n -th roots and so we adjoin $\frac{1}{n}$ to the preceding group. Therefore,

$$\pi_1^{\text{tr}}(GL) \simeq \mathbb{Z} \left[\frac{1}{2}, \frac{1}{3}, \frac{1}{4}, \dots \right]$$

Similarly, inclusion into $\pi_1^{\text{tr}}(GL)_{3!}$ picks up cube roots:

$$\pi_1^{\text{tr}}(GL)_6 \simeq \mathbb{Z} \left[\frac{1}{2}, \frac{1}{3} \right]$$

In the n -th inclusion, we pick up n -th roots and so we adjoin $\frac{1}{n}$ to the preceding group. Therefore,

$$\pi_1^{\text{tr}}(GL) \simeq \mathbb{Z} \left[\frac{1}{2}, \frac{1}{3}, \frac{1}{4}, \dots \right] \simeq \mathbb{Q}.$$

Similarly, inclusion into $\pi_1^{\text{tr}}(GL)_6$ picks up cube roots:

$$\pi_1^{\text{tr}}(GL)_6 \simeq \mathbb{Z} \left[\frac{1}{2}, \frac{1}{3} \right]$$

In the n -th inclusion, we pick up n -th roots and so we adjoin $\frac{1}{n}$ to the preceding group. Therefore,

$$\pi_1^{\text{tr}}(GL) \simeq \mathbb{Z} \left[\frac{1}{2}, \frac{1}{3}, \frac{1}{4}, \dots \right] \simeq \mathbb{Q}.$$

Thank You!
